

Corporate Announcement

Neugenesis presents at the 2010 World Vaccine Congress

Chantilly, Virginia

April 21, 2010

Neugenesis Corporation participated in the 2010 World Vaccine Congress held in Chantilly, VA, USA from April 19-22, 2010. The World Vaccine Congress brings together the vaccine industry's major players and their partners. Debbie Higgins, Vice President, Vaccine Development at Neugenesis spoke in a panel discussion during a session on "Cell Culture-Based Production: The Next Frontier" on Wednesday, April 21, 2009.

In recent years, a number of research projects have revolved around producing vaccines in animals and plants. At the World Vaccines Congress Dr. Richard Schwartz of NIAID termed cell-based alternatives to egg-based technologies as the next frontier.

Debbie Higgins of California-based Neugenesis detailed the NeuBIOS™ platform for the production of protein biologics. It combines specially developed strains of the fungus *Neurospora crassa* with paired expression plasmids and serves as the starting point for specific product production. According to Higgins, the system offers many advantages over the egg-based alternative, including speed; development times for new products are as short as 12 weeks. In addition, is scalable and flexible and requires less capital than the egg-based method.

About Neugenesis

Neugenesis Corporation is a privately held biotechnology company which has generated a diverse set of technology platforms for the world wide biotechnology and biopharmaceutical industry. In addition to its new position in vaccines, Neugenesis is also involved in development of technology for production of monoclonal antibodies for biodefense. The Company holds strong intellectual property positions in the areas of production of recombinant monoclonal antibodies, cell based gene-directed evolution, and cell based combinatorial biology. Neugenesis is actively seeking partners in the biopharmaceutical industry to rapidly move the technology into the marketplace.
